

# Compulsory electives

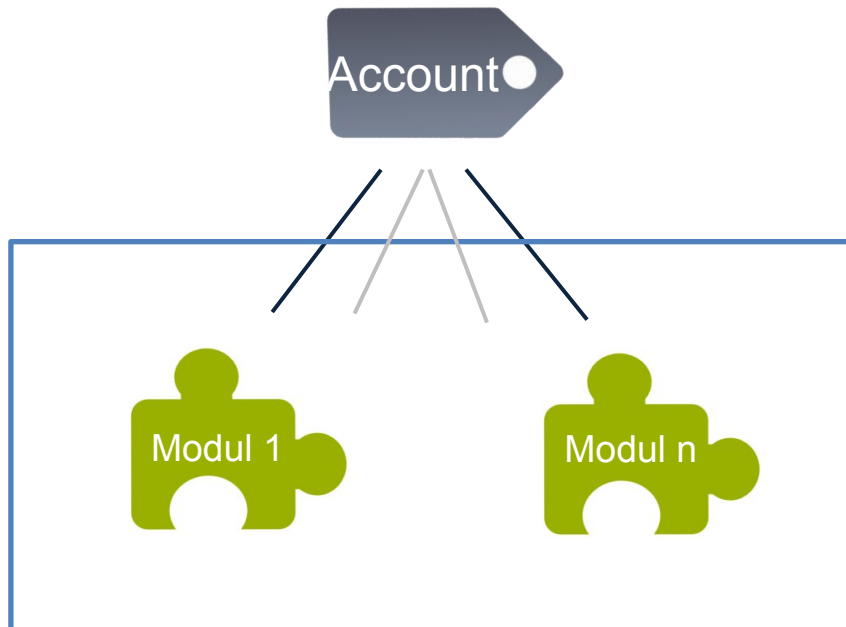

**In the case of non-university-wide compulsory electives, a distinction must be made between compulsory elective catalogs (e.g. specialization area A) and larger compulsory electives (e.g. all modules of faculty X or program Y).**

**These are mapped in campo in different ways:**

- For compulsory elective catalogs, all modules are concretely assigned to the account of the compulsory elective area.
- In case of larger compulsory elective areas, where the modules have common characteristics such as the affiliation to a study program or a faculty, all the elements do not have to be assigned individually, but can be determined via search sets.

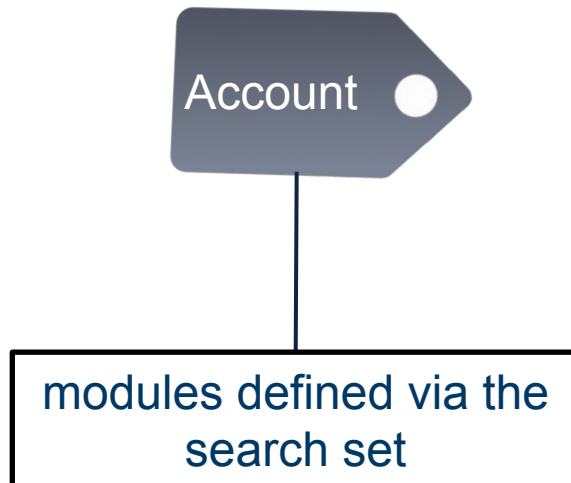

# #1 – Assignment of concrete modules

- **Specific module descriptions per assigned module.**
- **Regular updating required**
- **Transmission of module lists by the study program coordination to the department L2**
  - Central modeling of new modules
  - Decentralized collection of module descriptions

## #2 - Definition via search sets

- No assignment of concrete modules but all modules of a saved search set.
- The resulting search results are then assigned to the elective account instead of concrete modules
- Search queries are created centrally (department L2) and updated semester by semester
